Adeshipo Adebayo Oluwabukunmi

adeshipob@gmail.com || github.com/Bukunmi0817 || +234813680144

PROFILE

- Security-minded Software Engineer with hands-on experience across independent security research, DevOps and platform engineering, and backend automation.
- Found and responsibly disclosed high-impact flaws in web and mobile applications through bug bounty programs, including server misconfigurations that exposed proprietary files and leaked API keys.
- Built and ran production infrastructure end to end: CI/CD, Nginx and process management, observability stacks, and scheduled cloud pipelines that deliver data to clients without anyone touching them.
- B.Sc. in Computer Science and Engineering, Google Cybersecurity Certificate and HNG DevOps Certificate. Looking for a full-time security or DevOps role.

SKILLS & INTERESTS

Technical Skills: Python, JavaScript, Bash, C, HTML, CSS, Linux, Docker, Nginx, GitHub Actions (CI/CD), Terraform, AWS EC2, GCP, PostgreSQL, Prometheus, Grafana, Loki, Tempo, Selenium, Web Application Testing, Network Penetration Testing, Code Review, Report Writing.

Interests: Security Engineering, DevOps and Platform Engineering, Application Security Testing, Code Review, Security Research.

CERTIFICATIONS

Google Cybersecurity Certificate **Nov. 2025**

HNG DevOps Certificate **Jun. 2026**

CompTIA Security+ (In View)

RELEVANT EXPERIENCE

FlareTag **Sep. 2026**

DevOps Engineer

- Ran the full production infrastructure on AWS EC2: PM2 process management, Nginx, Supabase/PostgreSQL, and GitHub Actions CI/CD across dev, staging and production.
- Kept staging and production in parity, handled database migrations, and moved transactional email from Brevo to Resend.
- Set up the local development environment for the frontend team and diagnosed CORS and authentication issues across the stack.
- Led the move to a new GitHub organisation after an org-level security incident: mirrored both repos, repointed server remotes, and rebuilt Actions secrets and environments with deployments verified end to end.

Nexergybi **Aug. 2026**

Data Analyst and Python Developer

- Built scheduled data export pipelines for multiple clients that pull from FareHarbor, Sling and Inspira and deliver formatted reports to SharePoint automatically.
- Reverse-engineered undocumented web APIs and used headless Selenium where no API existed, then ran a full historical backfill of shift data.
- Set up a cloud VM (migrated from AWS EC2 to GCP) that runs every job on a schedule with no manual work, with Telegram alerts for failures and token expiry, plus disk-usage alerts and weekly maintenance.

Solar World **Oct. 2026**

Software Engineer

- Designed and built a customer database and management hub for a solar installation company with five branches, covering customer records, system and warranty details, invoices, documents and service history.
- Added role-based access for five staff roles so each team only sees the data it needs, with management-only staff account control and one-click access revocation.
- Built maintenance tracking that flags customers as up to date, due soon or overdue against a six-month service cycle, shown on a dashboard that can be filtered by branch.

Independent **Present**

Freelance Contractor and Security Researcher

- Ran an independent security practice delivering vulnerability assessment and disclosure through bug bounty programs (VDPs) for organisations worldwide.
- Discovered and responsibly disclosed critical server misconfigurations, proprietary file exposures and leaked API keys, directly improving the security of client applications.
- Wrote clear, actionable reports for development teams so flaws could be fixed quickly.
- Used Python and Bash to automate reconnaissance for web application and network testing.

EDUCATION

Obafemi Awolowo University, Ile-Ife, Nigeria **Aug. 2025**

B.Sc., Computer Science and Engineering
